

AI Roast Generator

Vibe Coding Assignment | Submitted by: [Your Name] | Roll No: [XXXX]

About this assignment

So for this assignment we had to make a C++ program that takes a person's name and gives them a funny roast message. Like a joke generator. I used Claude AI to help me write the code. Below I have written all the prompts I used and also one bug I found and fixed.

Prompt 1 - Getting the basic program

What I typed to the AI:

Write a beginner friendly C++ console program that generates funny roast messages. The program should ask the user for their name. Store at least 10 roast templates in a vector. Randomly select a roast and replace the placeholder {name} with the user's actual input. Make sure different roasts show every time the program runs by using srand and time. Add comments so beginners can understand the code.

What the AI gave me:

It gave me a full working program. It used a vector to store the roasts, used rand() and srand(time(0)) so the result changes every time, and replaced {name} using the find() and replace() functions. It also added comments which helped me understand the code.

Prompt 2 - Making the roasts funnier

What I typed to the AI:

The roasts are too basic and boring. Can you rewrite them to be funnier and more related to programmers and students. Like make jokes about bad code, procrastination, debugging, slow programs etc. Keep {name} in all of them.

Some of the new roasts it gave me:

"{name} writes code so slow that even a turtle switched to Python."

"{name} asked ChatGPT for help and even the AI said I need a moment."

"{name}'s debugging style is staring at the screen until the bug gets embarrassed and leaves."

"{name} once used a for loop to make tea. It never finished iterating."

These were actually really funny. I used all of them in my final code.

Prompt 3 - Bug fixing

The bug I found:

When I ran the program and just pressed Enter without typing any name, it still ran and printed a roast but with a blank space where the name should be. Like it said ' writes code so slow...' with nothing before it. Also if someone types a name with two words like Ali Khan it only reads Ali and ignores the last name.

The buggy part of the code:

```
cin >> userName; // only reads one word, cuts off last names // also no check if name
is empty so program just continues
```

What I typed to the AI to fix it:

My program has a bug. When I press enter without typing a name it still shows a roast but with a blank space instead of the name. Also if I type a two word name it only reads the first word. Please fix both problems and explain why this was happening.

What the AI changed it to:

```
getline(cin, userName); // now reads the full name including spaces if
(userName.empty()) { cout << "You must enter a name!" << endl; return 1; }
```

Why it was happening:

cin >> stops reading at the first space so full names get cut off. getline reads the whole line so names like Ali Khan now work properly. The empty check stops the program from running when nothing is typed.

Prompt 4 - Same roast showing twice in a row

What I typed to the AI:

When I press y to get another roast sometimes the same one shows up again. Can you fix it so the same roast never repeats two times in a row.

What the AI did:

It made a small function that remembers the last index used and keeps picking a new random number until it is different from the last one. It used a do while loop for this. After adding this the repeating problem was fixed.

```
int getRandomRoast(int total, int lastIndex) { int idx; do { idx = rand() % total; }
while (idx == lastIndex); return idx; }
```

Prompt 5 - Cleaning up the code

What I typed to the AI:

Can you clean up the code a bit. Put the name replacement part into its own function and add a small welcome message when the program starts. Also let the user ask for more roasts without restarting the program.

What changed:

It moved the name replacement logic into a function called replacePlaceholder which made the main function much shorter. It also added a simple welcome banner at the top and a loop so the user can keep getting roasts by pressing y.

Summary of all prompts

Prompt	What I asked	Did it work?
1	Generate the basic program	Yes, first try
2	Make roasts funnier	Yes, much better
3	Fix empty input and full name bug	Yes after the fix
4	Stop same roast repeating	Yes
5	Clean up code and add welcome message	Yes
